**SPECIFICATION AMENDMENTS** 

[0004] Please amend the specification by substituting the following paragraph for

paragraph [0008] of the originally filed application.

[0008] A managed environment can typically be accommodated by

different kinds of hosts, each of which may have different hosting

requirements to minimize threats to robustness and reliability. It would be

an advantage in the art to provide a way for a host to selectively disallow

certain classes of resource access to hosted code, where the hosting

requirements would not necessarily be based upon a security feature.

While different kinds of hosts can have different types of hosting

requirements, it would be problematic to provide a separate method to

perform the same function for each different kind of host and/or for each

different type of hosting requirement. Accordingly, it would be an advance

in the art to provide techniques for a host to prevent a call to a certain

method from a certain caller to perform a certain function that could

destabilize the hosting environment, while allowing the call to the same

method from a different and/or more highly trusted caller, where the

techniques could use the same method for different types of call

prevention and for different types of hosts.

[0005] Paragraph [0008], as amended and without mark-ups, are hereby provided

below.
